

C Reference Card (ANSI)

Program Structure/Functions

<i>type fnc</i> (<i>type</i> ₁ ,...)	function declarations
<i>type name</i>	external variable declarations
main() {	main routine
<i>declarations</i>	local variable declarations
<i>statements</i>	
}	
<i>type fnc</i> (<i>arg</i> ₁ ,...) {	function definition
<i>declarations</i>	local variable declarations
<i>statements</i>	
return <i>value</i> ;	
}	
/* */	comments
main(int argc, char *argv[])	main with args
exit(<i>arg</i>)	terminate execution

C Preprocessor

include library file	#include < <i>filename</i> >
include user file	#include " <i>filename</i> "
replacement text	#define <i>name text</i>
replacement macro	#define <i>name</i> (<i>var</i>) <i>text</i>
<i>Example.</i> #define max(A,B) ((A)>(B) ? (A) : (B))	
undefine	#undef <i>name</i>
quoted string in replace	#
concatenate args and rescan	##
conditional execution	#if, #else, #elif, #endif
is <i>name</i> defined, not defined?	#ifdef, #ifndef
<i>name</i> defined?	defined(<i>name</i>)
line continuation char	\

Data Types/Declarations

character (1 byte)	char
integer	int
float (single precision)	float
float (double precision)	double
short (16 bit integer)	short
long (32 bit integer)	long
positive and negative	signed
only positive	unsigned
pointer to int, float,...	*int, *float,...
enumeration constant	enum
constant (unchanging) value	const
declare external variable	extern
register variable	register
local to source file	static
no value	void
structure	struct
create name by data type	typedef <i>typename</i>
size of an object (type is <i>size_t</i>)	sizeof <i>object</i>
size of a data type (type is <i>size_t</i>)	sizeof(<i>type name</i>)

Initialization

initialize variable	<i>type name</i> = <i>value</i>
initialize array	<i>type name</i> []={ <i>value</i> ₁ ,...}
initialize char string	char <i>name</i> []="string"

Constants

long (suffix)	L or l
float (suffix)	F or f
exponential form	e
octal (prefix zero)	0
hexadecimal (prefix zero-ex)	0x or 0X
character constant (char, octal, hex)	'a', '\ooo', '\xhh'
newline, cr, tab, backspace	\n, \r, \t, \b
special characters	\\, \?, \', \"
string constant (ends with '\0')	"abc...de"

Pointers, Arrays & Structures

declare pointer to <i>type</i>	<i>type</i> * <i>name</i>
declare function returning pointer to <i>type</i>	<i>type</i> *f()
declare pointer to function returning <i>type</i>	<i>type</i> (*pf)()
generic pointer type	void *
null pointer	NULL
object pointed to by <i>pointer</i>	* <i>pointer</i>
address of object <i>name</i>	& <i>name</i>
array	<i>name</i> [<i>dim</i>]
multi-dim array	<i>name</i> [<i>dim</i> ₁][<i>dim</i> ₂]....

Structures

```
struct tag {           structure template
    declarations      declaration of members
};
```

create structure	struct tag name
member of structure from template	name.member
member of pointed to structure	pointer -> member

Example. (*p).x and p->x are the same

single value, multiple type structure	union
bit field with <i>b</i> bits	member : <i>b</i>

Operators (grouped by precedence)

structure member operator	name.member
structure pointer	pointer->member
increment, decrement	++, --
plus, minus, logical not, bitwise not	+, -, !, ~
indirection via pointer, address of object	*pointer, &name
cast expression to type	(type) expr
size of an object	sizeof
multiply, divide, modulus (remainder)	*, /, %
add, subtract	+, -
left, right shift [bit ops]	<<, >>
comparisons	>, >=, <, <=
comparisons	==, !=
bitwise and	&
bitwise exclusive or	^
bitwise or (incl)	
logical and	&&
logical or	
conditional expression	expr ₁ ? expr ₂ : expr ₃
assignment operators	+=, -=, *=, ...
expression evaluation separator	,

Unary operators, conditional expression and assignment operators group right to left; all others group left to right.

Flow of Control

statement terminator	;
block delimiters	{ }
exit from <code>switch</code> , <code>while</code> , <code>do</code> , <code>for</code>	<code>break</code>
next iteration of <code>while</code> , <code>do</code> , <code>for</code>	<code>continue</code>
go to	<code>goto label</code>
label	<code>label:</code>
return value from function	<code>return expr</code>

Flow Constructions

if statement	<code>if (expr) statement</code> <code>else if (expr) statement</code> <code>else statement</code>
while statement	<code>while (expr)</code> <code>statement</code>
for statement	<code>for (expr₁; expr₂; expr₃)</code> <code>statement</code>
do statement	<code>do statement</code> <code>while(expr);</code>
switch statement	<code>switch (expr) {</code> <code>case const₁: statement₁ break;</code> <code>case const₂: statement₂ break;</code> <code>default: statement</code> <code>}</code>

ANSI Standard Libraries

<assert.h> <ctype.h> <errno.h> <float.h> <limits.h>
<locale.h> <math.h> <setjmp.h> <signal.h> <stdarg.h>
<stddef.h> <stdio.h> <stdlib.h> <string.h> <time.h>

Character Class Tests <ctype.h>

alphanumeric?	<code>isalnum(c)</code>
alphabetic?	<code>isalpha(c)</code>
control character?	<code>iscntrl(c)</code>
decimal digit?	<code>isdigit(c)</code>
printing character (not incl space)?	<code>isgraph(c)</code>
lower case letter?	<code>islower(c)</code>
printing character (incl space)?	<code>isprint(c)</code>
printing char except space, letter, digit?	<code>ispunct(c)</code>
space, formfeed, newline, cr, tab, vtab?	<code>isspace(c)</code>
upper case letter?	<code>isupper(c)</code>
hexadecimal digit?	<code>isxdigit(c)</code>
convert to lower case?	<code>tolower(c)</code>
convert to upper case?	<code>toupper(c)</code>

String Operations <string.h>

`s,t` are strings, `cs,ct` are constant strings

length of <code>s</code>	<code>strlen(s)</code>
copy <code>ct</code> to <code>s</code>	<code>strcpy(s,ct)</code>
up to <code>n</code> chars	<code>strncpy(s,ct,n)</code>
concatenate <code>ct</code> after <code>s</code>	<code>strcat(s,ct)</code>
up to <code>n</code> chars	<code>strncat(s,ct,n)</code>
compare <code>cs</code> to <code>ct</code>	<code>strcmp(cs,ct)</code>
only first <code>n</code> chars	<code>strncmp(cs,ct,n)</code>
pointer to first <code>c</code> in <code>cs</code>	<code>strchr(cs,c)</code>
pointer to last <code>c</code> in <code>cs</code>	<code>strrchr(cs,c)</code>
copy <code>n</code> chars from <code>ct</code> to <code>s</code>	<code>memcpy(s,ct,n)</code>
copy <code>n</code> chars from <code>ct</code> to <code>s</code> (may overlap)	<code>memmove(s,ct,n)</code>
compare <code>n</code> chars of <code>cs</code> with <code>ct</code>	<code>memcmp(cs,ct,n)</code>
pointer to first <code>c</code> in first <code>n</code> chars of <code>cs</code>	<code>memchr(cs,c,n)</code>
put <code>c</code> into first <code>n</code> chars of <code>cs</code>	<code>memset(s,c,n)</code>

C Reference Card (ANSI)

Input/Output <stdio.h>

Standard I/O

standard input stream	<code>stdin</code>
standard output stream	<code>stdout</code>
standard error stream	<code>stderr</code>
end of file	<code>EOF</code>
get a character	<code>getchar()</code>
print a character	<code>putchar(<i>chr</i>)</code>
print formatted data	<code>printf("format", arg₁,...)</code>
print to string <i>s</i>	<code>sprintf(<i>s</i>, "format", arg₁,...)</code>
read formatted data	<code>scanf("format", &name₁,...)</code>
read from string <i>s</i>	<code>sscanf(<i>s</i>, "format", &name₁,...)</code>
read line to string <i>s</i> (< max chars)	<code>gets(<i>s</i>, max)</code>
print string <i>s</i>	<code>puts(<i>s</i>)</code>

File I/O

declare file pointer	<code>FILE *<i>fp</i></code>
pointer to named file	<code>fopen("name", "mode")</code>
modes: <i>r</i> (read), <i>w</i> (write), <i>a</i> (append)	
get a character	<code>getc(<i>fp</i>)</code>
write a character	<code>putc(<i>chr</i>, <i>fp</i>)</code>
write to file	<code>fprintf(<i>fp</i>, "format", arg₁,...)</code>
read from file	<code>fscanf(<i>fp</i>, "format", arg₁,...)</code>
close file	<code>fclose(<i>fp</i>)</code>
non-zero if error	<code>ferror(<i>fp</i>)</code>
non-zero if EOF	<code>feof(<i>fp</i>)</code>
read line to string <i>s</i> (< max chars)	<code>fgets(<i>s</i>, max, <i>fp</i>)</code>
write string <i>s</i>	<code>fputs(<i>s</i>, <i>fp</i>)</code>

Codes for Formatted I/O: "%-+ 0*w.pmc*"

- left justify
- + print with sign
- space* print space if no sign
- 0 pad with leading zeros
- w* min field width
- p* precision
- m* conversion character:
 - h* short, *l* long, *L* long double
- c* conversion character:
 - d, i* integer *u* unsigned
 - c* single char *s* char string
 - f* double *e, E* exponential
 - o* octal *x, X* hexadecimal
 - p* pointer *n* number of chars written
 - g, G* same as *f* or *e, E* depending on exponent

Variable Argument Lists <stdarg.h>

declaration of pointer to arguments	<code>va_list <i>name</i>;</code>
initialization of argument pointer	<code>va_start(<i>name</i>, <i>lastarg</i>)</code>
<i>lastarg</i> is last named parameter of the function	
access next unnamed arg, update pointer	<code>va_arg(<i>name</i>, <i>type</i>)</code>
call before exiting function	<code>va_end(<i>name</i>)</code>

Standard Utility Functions <stdlib.h>

absolute value of int <i>n</i>	<code>abs(n)</code>
absolute value of long <i>n</i>	<code>labs(n)</code>
quotient and remainder of ints <i>n,d</i>	<code>div(n,d)</code>
returns structure with <code>div_t.quot</code> and <code>div_t.rem</code>	
quotient and remainder of longs <i>n,d</i>	<code>ldiv(n,d)</code>
returns structure with <code>ldiv_t.quot</code> and <code>ldiv_t.rem</code>	
pseudo-random integer [0,RAND_MAX]	<code>rand()</code>
set random seed to <i>n</i>	<code>srand(n)</code>
terminate program execution	<code>exit(status)</code>
pass string <i>s</i> to system for execution	<code>system(s)</code>

Conversions

convert string <i>s</i> to double	<code>atof(s)</code>
convert string <i>s</i> to integer	<code>atoi(s)</code>
convert string <i>s</i> to long	<code>atol(s)</code>
convert prefix of <i>s</i> to double	<code>strtod(s, endp)</code>
convert prefix of <i>s</i> (base <i>b</i>) to long	<code>strtoul(s, endp, b)</code>
same, but unsigned long	<code>strtoul(s, endp, b)</code>

Storage Allocation

allocate storage	<code>malloc(size)</code> , <code>calloc(nobj, size)</code>
change size of object	<code>realloc(pts, size)</code>
deallocate space	<code>free(ptr)</code>

Array Functions

search array for key	<code>bsearch(key, array, n, size, cmp())</code>
sort array ascending order	<code>qsort(array, n, size, cmp())</code>

Time and Date Functions <time.h>

processor time used by program	<code>clock()</code>
<i>Example.</i> <code>clock()/CLOCKS_PER_SEC</code> is time in seconds	
current calendar time	<code>time()</code>
$time_2 - time_1$ in seconds (double)	<code>difftime(time_2, time_1)</code>
arithmetic types representing times	<code>clock_t, time_t</code>
structure type for calendar time comps	<code>tm</code>
<i>tm_sec</i>	seconds after minute
<i>tm_min</i>	minutes after hour
<i>tm_hour</i>	hours since midnight
<i>tm_mday</i>	day of month
<i>tm_mon</i>	months since January
<i>tm_year</i>	years since 1900
<i>tm_wday</i>	days since Sunday
<i>tm_yday</i>	days since January 1
<i>tm_isdst</i>	Daylight Savings Time flag
convert local time to calendar time	<code>mktime(tp)</code>
convert time in <i>tp</i> to string	<code>asctime(tp)</code>
convert calendar time in <i>tp</i> to local time	<code>ctime(tp)</code>
convert calendar time to GMT	<code>gmtime(tp)</code>
convert calendar time to local time	<code>localtime(tp)</code>
format date and time info	<code>strftime(s, smax, "format", tp)</code>
<i>tp</i> is a pointer to a structure of type <code>tm</code>	

Mathematical Functions <math.h>

Arguments and returned values are double

trig functions	<code>sin(x)</code> , <code>cos(x)</code> , <code>tan(x)</code>
inverse trig functions	<code>asin(x)</code> , <code>acos(x)</code> , <code>atan(x)</code>
<code>arctan(y/x)</code>	<code>atan2(y,x)</code>
hyperbolic trig functions	<code>sinh(x)</code> , <code>cosh(x)</code> , <code>tanh(x)</code>
exponentials & logs	<code>exp(x)</code> , <code>log(x)</code> , <code>log10(x)</code>
exponentials & logs (2 power)	<code>ldexp(x,n)</code> , <code>frexp(x,*e)</code>
division & remainder	<code>modf(x,*ip)</code> , <code>fmod(x,y)</code>
powers	<code>pow(x,y)</code> , <code>sqrt(x)</code>
rounding	<code>ceil(x)</code> , <code>floor(x)</code> , <code>fabs(x)</code>

Integer Type Limits <limits.h>

The numbers given in parentheses are typical values for the constants on a 32-bit Unix system.

<code>CHAR_BIT</code>	bits in <code>char</code>	(8)
<code>CHAR_MAX</code>	max value of <code>char</code>	(127 or 255)
<code>CHAR_MIN</code>	min value of <code>char</code>	(-128 or 0)
<code>INT_MAX</code>	max value of <code>int</code>	(+32,767)
<code>INT_MIN</code>	min value of <code>int</code>	(-32,768)
<code>LONG_MAX</code>	max value of <code>long</code>	(+2,147,483,647)
<code>LONG_MIN</code>	min value of <code>long</code>	(-2,147,483,648)
<code>SCHAR_MAX</code>	max value of <code>signed char</code>	(+127)
<code>SCHAR_MIN</code>	min value of <code>signed char</code>	(-128)
<code>SHRT_MAX</code>	max value of <code>short</code>	(+32,767)
<code>SHRT_MIN</code>	min value of <code>short</code>	(-32,768)
<code>UCHAR_MAX</code>	max value of <code>unsigned char</code>	(255)
<code>UINT_MAX</code>	max value of <code>unsigned int</code>	(65,535)
<code>ULONG_MAX</code>	max value of <code>unsigned long</code>	(4,294,967,295)
<code>USHRT_MAX</code>	max value of <code>unsigned short</code>	(65,536)

Float Type Limits <float.h>

<code>FLT_RADIX</code>	radix of exponent rep	(2)
<code>FLT_ROUNDS</code>	floating point rounding mode	
<code>FLT_DIG</code>	decimal digits of precision	(6)
<code>FLT_EPSILON</code>	smallest x so $1.0 + x \neq 1.0$	(10^{-5})
<code>FLT_MANT_DIG</code>	number of digits in mantissa	
<code>FLT_MAX</code>	maximum floating point number	(10^{37})
<code>FLT_MAX_EXP</code>	maximum exponent	
<code>FLT_MIN</code>	minimum floating point number	(10^{-37})
<code>FLT_MIN_EXP</code>	minimum exponent	
<code>DBL_DIG</code>	decimal digits of precision	(10)
<code>DBL_EPSILON</code>	smallest x so $1.0 + x \neq 1.0$	(10^{-9})
<code>DBL_MANT_DIG</code>	number of digits in mantissa	
<code>DBL_MAX</code>	max <code>double</code> floating point number	(10^{37})
<code>DBL_MAX_EXP</code>	maximum exponent	
<code>DBL_MIN</code>	min <code>double</code> floating point number	(10^{-37})
<code>DBL_MIN_EXP</code>	minimum exponent
